

Committee on Earth Observation Satellites

# Activities of CEOS WGCV Atmospheric Composition Subgroup and the CGMS GSICS

*and Towards an operational GHG monitoring system*

B. Bojkov (WGCV/ACSG), R. Munro  
(CGMS/GSICS), A. Kuze (WGCV)

CEOS WGClimate 10

Marrakech, Morocco

20 March 2019

1. CEOS/WGCV/ACSG Activities
2. CGMS/GSICS Activities pertinent to GHG monitoring
3. Towards an operational GHG monitoring system

To ensure accurate and traceable calibration of remotely-sensed atmospheric composition radiance data and validation of higher level products, for application to atmospheric composition, land, ocean, and climate research.

***Reminder: the framework/cooperation/best practises in AC validation exists for 30+ years (onset of O<sub>3</sub> trend reports in the 1980s, WMO/GAW, NDACC, ... )***

- WGCV/ACSG sub-group works as a “task team” - *numerous thematic meetings with members throughout the year in related fora, including the AC-VC, GSCIS-UVSG, NDACC SG, AEROSAT, Cal/Val and FRM meetings, etc.*
- WGCV/ACSG participated/organised: *cloud masking for medium-resolution sensors ws, AQ FRM coordination (@AGU 2017 & 2018), CEOS/CGMS MW imager gap task group (AGU, CGMS Plenary), ground-based AQ FRM gap analysis (Feb. ‘18), German Cal/Val Symposium (June ‘18), etc.*

- Participation/interest in ACSG has always been challenging...  
*focus by agencies in the last 10-15 years has been shifting from research missions to operational missions addressing air quality, green house gases, and down-stream services*
- CGMS/GSICS-UVSG addresses many activities for the operational AC missions... with the benefit of the inter-calibration activities
- GHG mission interoperability is critical especially in the next years as operational missions will be launched...

**Global Space-based Inter-Calibration System (GSICS)** is an international collaborative effort initiated in 2005 by the World Meteorological Organization (WMO) and the Coordination Group for Meteorological Satellites (CGMS) to **1-monitor, 2-improve and 3-harmonize the quality of observations from operational weather and environmental satellites** of the Global Observing System (GOS).

**GSICS aims at ensuring consistent accuracy among space-based observations worldwide for climate monitoring, weather forecasting, and environmental applications.**

This is achieved through a **comprehensive calibration strategy** which involves:

- **monitoring instrument performances,**
- **operational inter-calibration of satellite instruments,**
- **tying the measurements to absolute references and standards,**  
**and**
- **recalibration of archived data.**

**GSICS delivers calibration corrections needed for accurately integrating data from multiple observing systems into products, applications and services.**

GSICS contributes to the integration of satellite data within the WMO Integrated Global Observing Systems (WIGOS) and within the Global Earth Observation System of Systems (GEOSS) of the Group on Earth Observations (GEO).

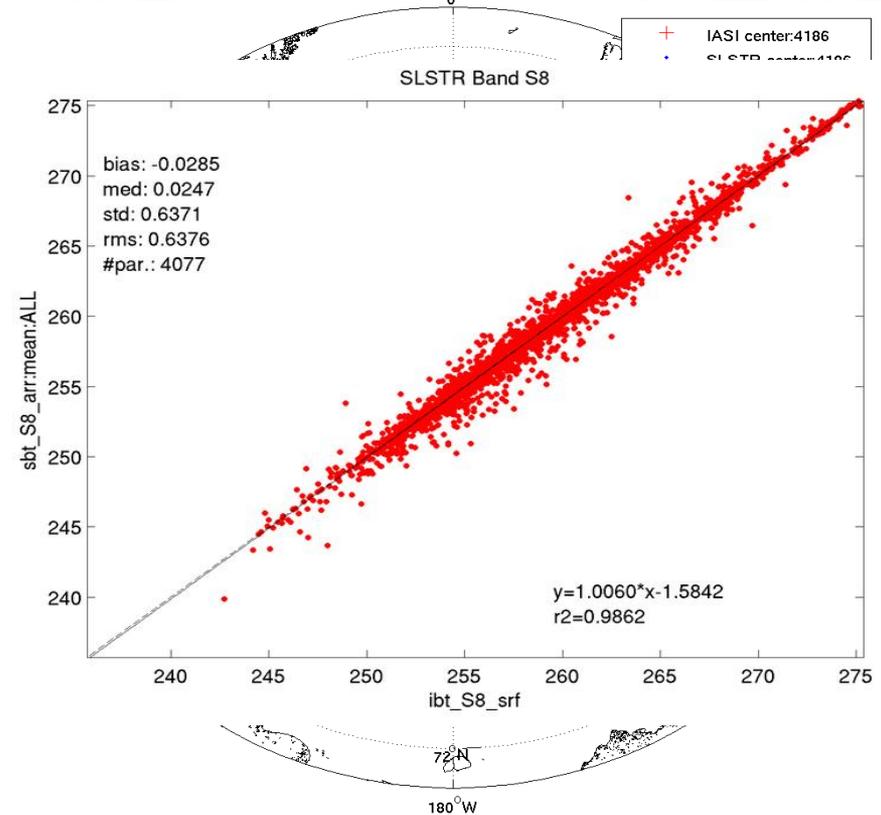

# Sentinel-a3/SLSTR: first calibration check

- Apply GSICS Simultaneous Nadir Observations (SNO) methodology to intercompare the Sentinel-3/SLSTR with Metop-IASI instruments as a first check:
  - *10 min. satellite co-location, pixel aggregation without stray-light correction*
- Extremely challenging process because of the data volumes involved and the complexity of the matching of the instrument fields of view

*This pragmatic approach to monitor the performance of the Sentinel-3/SLSTR using accepted international best practices (SNO) should be implemented into operational chains – especially in light of the launch of future sensors*

W\_XX-EUMETSAT-Darmstadt,HYPERSPECT+SOUNDING,METOPA+IASI\_C\_EUMP\_20160428084458\_49421\_eps\_o\_11c

- Sentinel-3a and Sentinel-3b have been operated in “tandem” configuration from June to September 2018. The two platforms are flying with ~30s separation on the same orbit.
- The main purpose of this configuration is to allow inter-calibration activities

#### Objective:

- To identify the mutual behavior of OLCI-B vs OLCI-A and SLSTR-B vs SLSTR-A

#### Constraints:

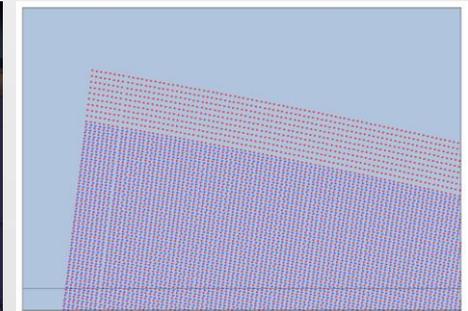

- To run a systematic intercomparison over large dataset
- To minimize the manipulation of radiances

Scenario Details

## Sentinel 3 - OLCI - Tandem Configuration - Band Oa01 @400 nm

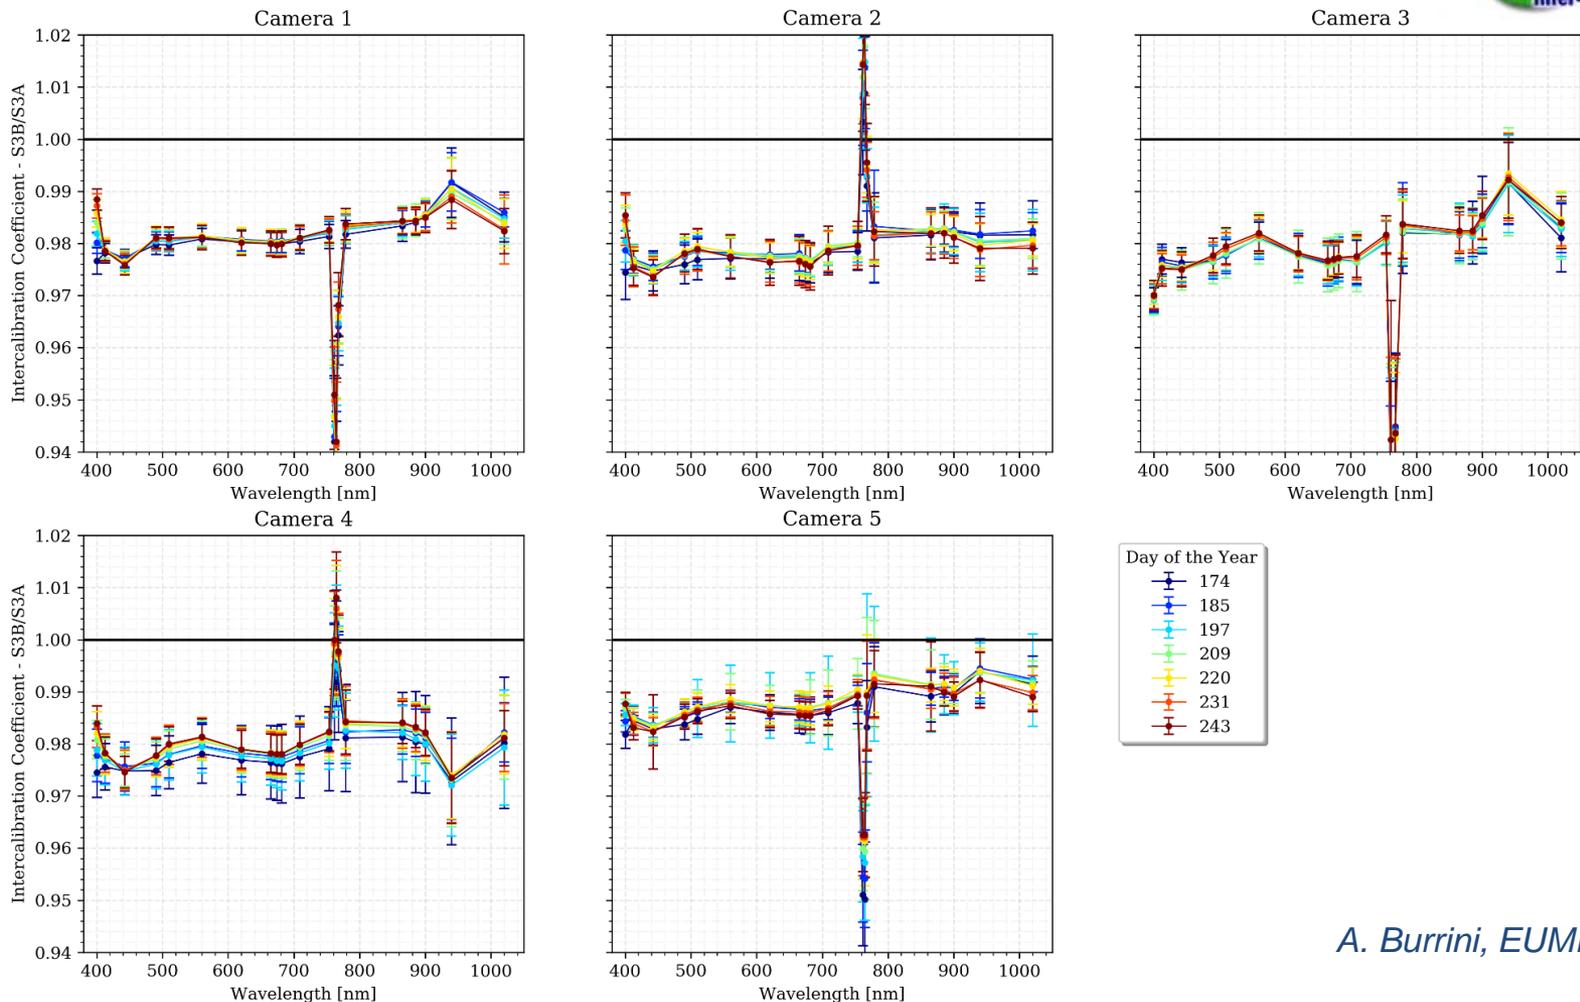

A. Burrini, EUMETSAT

# OLCI: Inter-band Evolution per Camera (reflectance)

S3A-S3B OLCI Tandem Phase - Interband Temporal Evolution

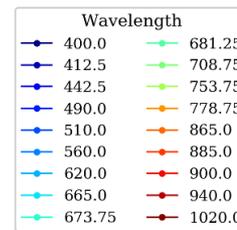

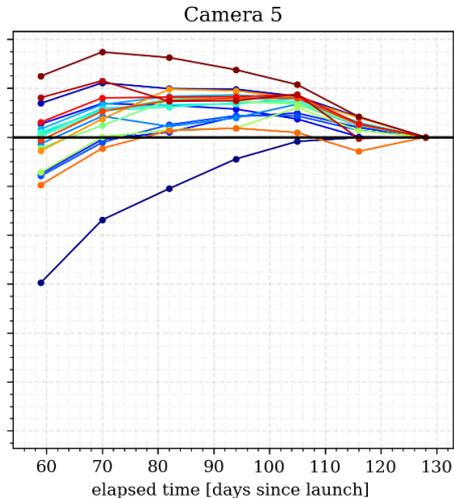

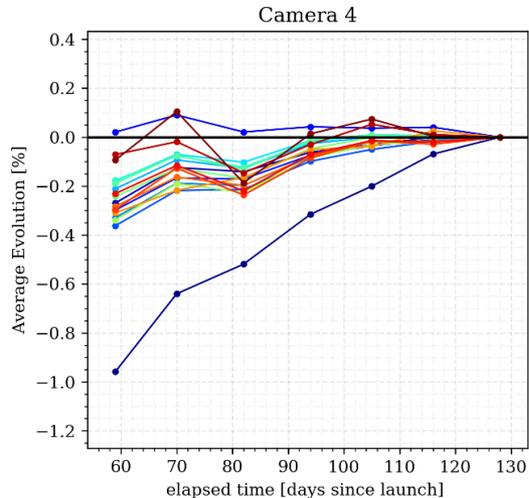

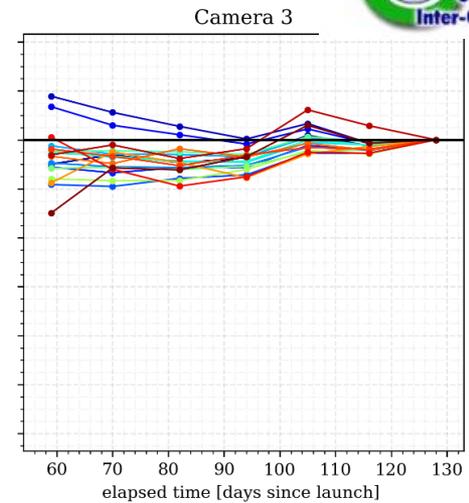

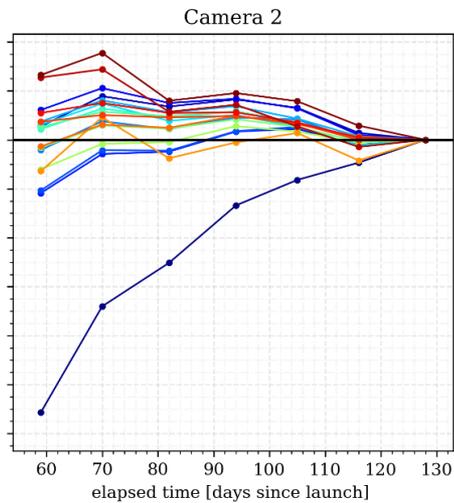

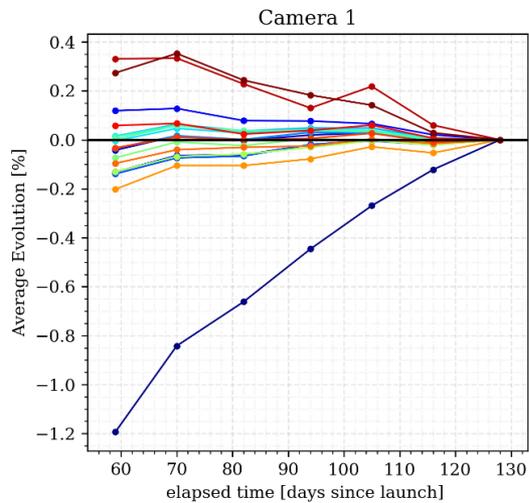

A. Burrini, EUMETSAT

# OLCI: Relative Time Evolution (no O<sub>2</sub> bands)

S3A-S3B OLCI Tandem Phase - Relative Temporal Evolution

Analysis of 1 full day every ~2 weeks:

- 2018-06-23
- 2018-07-04
- 2018-07-14
- 2018-07-28
- 2018-08-08
- 2018-08-19
- 2018-08-31

A. Burrini, EUMETSAT

Support to GHG instrument calibration in GSCICS falls under the newly renamed Reflective Solar Spectrometers Subgroup (GSICS/UVSG)

The scope of the subgroup is **addressing spectrometers operating in the UV – SWIR range, with the following focus areas:**

1. Pre-launch calibration and characterisation is a major focus area, for all but particularly for GHG missions;
2. Solar calibration including interactions with the solar community which have already been initiated;
3. Lunar calibration where the focus will be on UV and spectrally resolved data, contributing to other lunar calibration activities;
4. Polarization (also for lunar calibration where possible);
5. Inter-calibration and development of common methods for use of pseudo-invariant targets & vicarious calibration sites (with a homogeneous surface over a sufficiently large area) will be further developed. *Noting that the focus is on the atmospheric absorption.*

## Disclaimer:

***“Towards an operational GHG monitoring system” is here within the scope of the satellite systems, specifically addressing the measurement capabilities and performances***

- **CEOS WP CV-18: Greenhouse gas reference standards for interoperability** – *“Develop list of reference standards for CO<sub>2</sub> and CH<sub>4</sub> products that are suitable for use in intercomparison of multiple missions”* with reporting deadline Q4/2019
- **Release of the CEOS AC-VC GHG Whitepaper in Q3/2018**

## Short-term:

1. Address the WP action CV-18 with respect to CO<sub>2</sub>, CH<sub>4</sub> (and CO, N<sub>2</sub>O)  
Level-2 products
2. Identify the current shortcomings/gaps/sustainability in GHG Cal/Val, and formulate recommendations on the medium- to long-term way forward →  
*i.e. specific focus on GHG Fiducial Reference Measurement (FRM)*
3. Prepare a position/way forward paper to close the action CV-18 by mid-2020

# Towards an operational GHG monitoring system (ii)

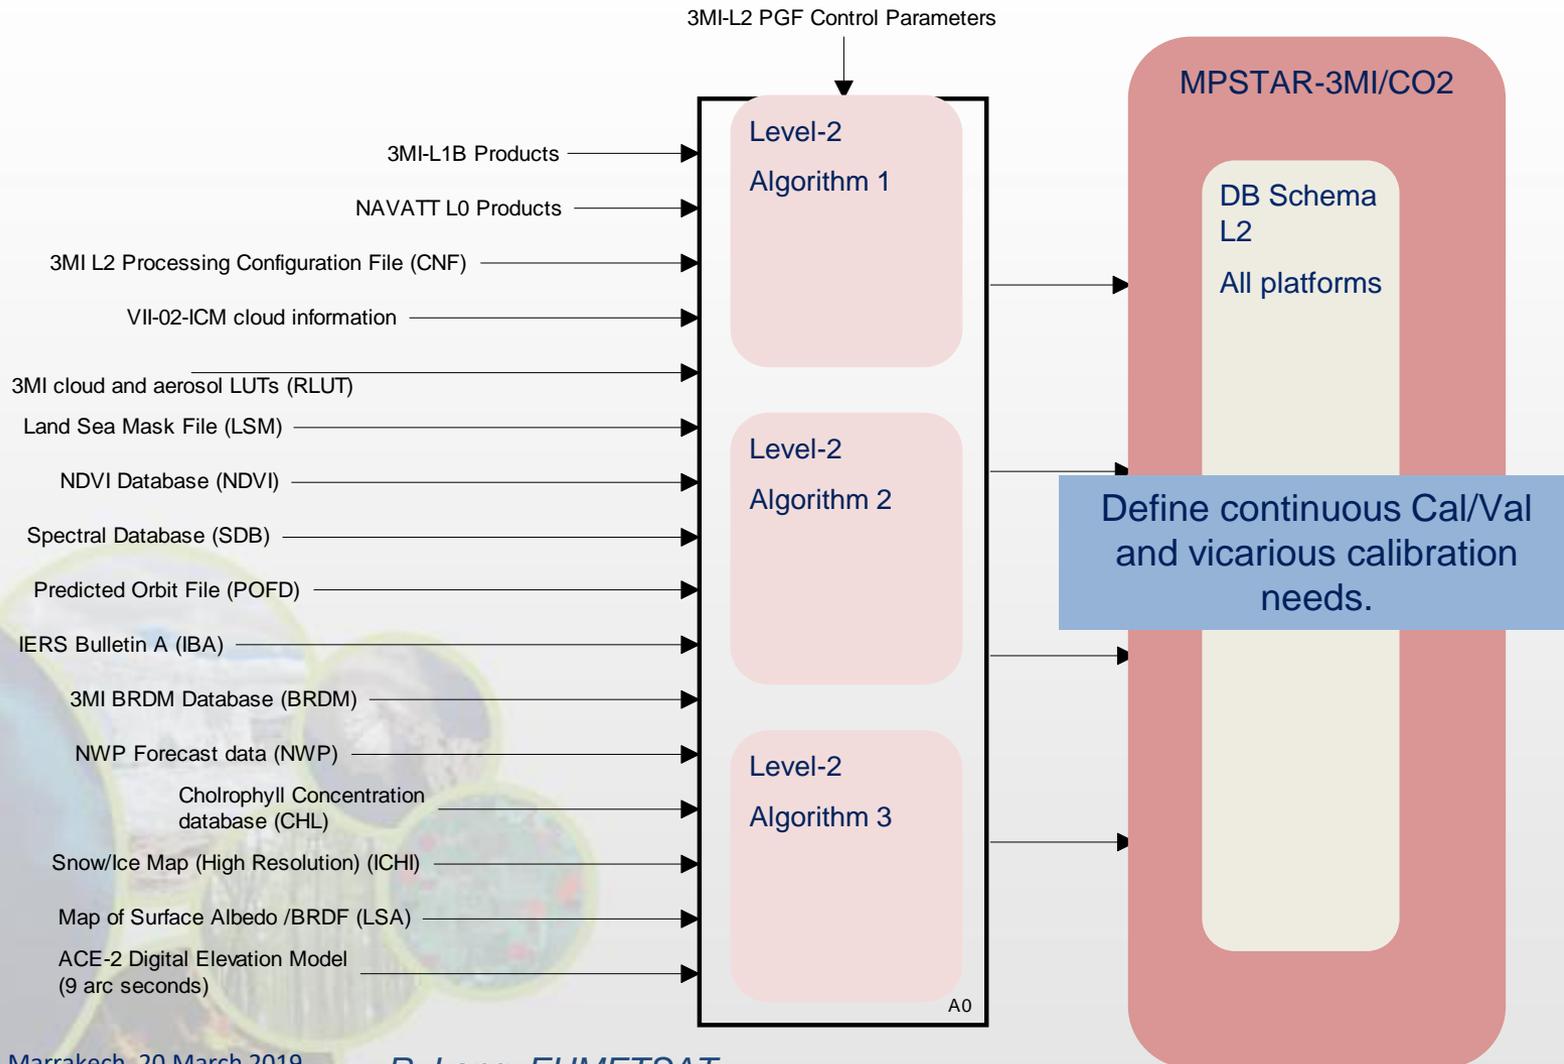

## Medium to long term:

1. Based on the expected outcome of the short-term, address a) improvements/gaps in the (inter-)calibration of sensors (in cooperation with GSICS), b) the level-2 validation infrastructures (GB algorithm inter-comparisons, and geographical/geophysical gaps for FRMs)
2. Identify long-term validation needs (2025-on) and potential process study needs (e.g. aircraft campaigns to characterise sources, challenging geophysical conditions)
3. Work towards an operational reporting on the quality of space-borne GHG measurements and the underlying Cal/Val infrastructure

# Towards an operational GHG monitoring system (iii)

Example from EUMETSAT 3MI/CO2M G/S concepts:

Numerous preparation meetings/telecons on FRMs have taken place since Summer 2018, in particular wrt GHGs FRMs, with JAXA, NASA, ESA, EC, EEA  
→ *general consensus on the way forward addressing the “Greenhouse gas reference standards for interoperability” for the long-term*

- *1<sup>st</sup> European coordination meeting on GHG FRMs, with focus on the current status and long-term sustainability of the European component, planned for 15 April at EUMETSAT*
- *Dedicated WGCV/ACSG meeting dedicated to the GHG FRMs planned at JAXA next October → close the action CV-18 by mid-2020*

*Thank you for your attention...*

*Questions?*
